

Project Title:

Ferns and Petals Sales Analysis Dashboard – 2025

Objective:

To analyze sales data from Ferns and Petals (FNP), a gift delivery platform, to uncover actionable insights into customer behaviour, sales trends, product performance, and delivery logistics. The goal is to help the company optimize marketing strategies, enhance customer satisfaction, and improve operational efficiency.

Key Business Questions Answered:

1. **Total Revenue:** ₹408,194 from 149 orders.
 2. **Average Delivery Time:** 5.46 days.
 3. **Customer Spend:** ₹2,789.56 average per customer.
 4. **Monthly Sales Trends:** April and October were peak months.
 5. **Top Products by Revenue:** ‘Deserunt Box’ and ‘Fuga Set’ led in revenue.
 6. **City-wise Sales:** Sriniketan, Durgapur, and Ratlam placed the most orders.
 7. **Occasion-wise Revenue:** Raksha Bandhan and Anniversary topped the list.
 8. **Category Performance:** Colors and Sweets performed best.
 9. **Gender Spending:** Female customers contributed more revenue.
 10. **Time-based Sales Pattern:** Orders peak at 4 AM, 12 PM, and 10 PM.
-

Tools & Technologies Used:

- **Power Pivot** – for advanced data modelling
 - **Power Query** – for data cleaning and transformation
 - **DAX Functions** – to create measures like Total Revenue, Avg. Delivery Time, etc.
 - **Pivot Tables & Charts** – for dynamic aggregation and analysis
 - **Slicers & Filters** – to enhance interactivity of the dashboard
 - **Excel Dashboard Design** – to visualize KPIs, trends, and comparisons
-

Relationship Between Order Quantity and Delivery Time

An analysis of order volume vs. delivery time indicates that **cities with higher order quantities tend to experience slightly longer delivery durations**, possibly due to logistics strain. For example, **Sriniketan**, which had the highest number of orders, shows above-average delivery times. This suggests a **positive correlation** between **order quantity and delivery time**, and highlights the need for **logistics optimization** in high-demand regions.

Key Insights:

- Most customers shop during weekends and at specific peak times of the day.
 - Orders for certain festivals (like Raksha Bandhan) are high but related product categories underperform.
 - High revenue does not always align with high product popularity—there's room to adjust inventory and marketing.
 - Delivery times can be improved in top-order cities to maintain customer satisfaction.
-

Recommendations:

1. **Optimize logistics** in high-order cities to reduce delivery delays.
 2. **Promote top-selling products** during peak occasions using targeted campaigns.
 3. **Discontinue or improve underperforming products** in high-traffic seasons.
 4. **Leverage peak order times** (4 AM, 12 PM, 10 PM) for promotional emails or flash sales.
 5. **Enhance data segmentation by gender and location** to tailor offerings and marketing.
